

Augmented Reality Applications Overlaid on Surgical Environments

Jacob Zeitzew
Cofounder of OnClass

This Past Year

- 2nd Annual Wearable Technology in Healthcare Society - keynote @ Academisch Medisch Centrum in Amsterdam
- Wearables in Healthcare Pilot Challenge - finalist @ Google Cambridge
- 2015 Developer of the year - shortlisted @ The Technology Expo in London

Key Points

- The differences between Augmented Reality and Virtual Reality
- How hospitals can succeed by fostering innovation and technology
- How to promote to best possible practices for a new generation of surgeons

Introductions

AR vs VR

**Optomechanical Engineering
Structures and Tumor Analysis**

Smart Glasses Civil Engineering Uses

- On and Offsite consulting with a foreman or engineer
- Streamlined pre-work checklist
- Easier product ordering

Remote Structural Analysis Utilizing Optical Heads up Displays And Unmanned Aerial Vehicles

Dr. I. Bartolli Jacob Ze
Dr. A. Kontsos Eric Heg
Dr. A. Pradhan Andrew
Shi Ye

Introduction

Current methods and techniques of Civil Infrastructure are out of date. We're creating Google Glass applications to detect cracks and erosion over time with high accuracy by comparing pictures taken at specific places looking at different angles with pictures taken at the same place looking at the same angle at a later point in time, we're now more accurately measuring the effect time has taken at the joints and connections of the structure. Currently, the field of Bridge Inspection requires the use of heavy machinery, which puts trained professionals in danger, to go up to view, analyze, and record data. We're able to collect data in real time by the use of Aerial Vehicles, GoPros, Google Glass, unreachable viewing angles and more. It was established and proven that the Parrot AR Drone with a GoPro3+ Silver Edition Camera could detect damage comparable to current visual inspection. The final application allows Inspectors to more accurately log data, information and allow inspectors to guide technicians at the location.

Applications

Structural Monitoring
Damage Assessment and Photogrammetry
Structural Identification
Structural Health Monitoring and Deformation Analysis

Technologies used

Google Glass

Augmented reality transparent heads-up display. The first wearable device produced by a corporation providing augmented reality.

Parrot AR 2.0

One of the most popular QuadCopters with the load capacity of 2.5kg and a video camera with a long battery life.

GoPro

A rugged camera which provides a direct feed to the computer in real time through wifi.

Current Methods

Current civil infrastructure analysis tools include; Cleaning tools, Inspection Tools (pocket knife, chipping hammer, visual aid tools (magnifying glass, mirror), Basic measuring equipment (thermometer, tape measurer), Recording instruments (paper, pencil, camera, flash drive, laptop), Safety/Miscellaneous (harness, insect repellent, markers). These tools are used for qualitative and quantitative on site measurement and general recordings.

Fig. 1
A land based bridge truck that operates in water depths up to 9ft.

Fig. 2
Boats with working heights up to 88ft with shallow water capabilities of less than a foot

Fig. 3
Structure based access on tensioned cables. Not limited to bridges, rigging is available to inspect piers, towers, dams and tall buildings.

Future Challenges

Drones have a limited payload, there are current public usage regulations, and they can only be flown during a time without heavy winds. Neither drones nor Glass have been accepted as a part of modern society yet and both systems do not have a long enough battery life.

Fig 4 and 5.
The view of and from the system.

Conclusion

It's a crucial aspect of Civil Engineering to maintain the infrastructure for the safety of the civilians. By the use of the Google Glass, Quadcopters, and signal emitting cameras, we were able to create android applications to promote safety, communications, and early detection of important data about infrastructure after a period of time or after a natural disaster. Structural analysis has been performed for decades. With access to revolutionary technology our team has been able to connect current bridge status to experienced inspectors who would otherwise be unable to view those specific vantage points, making civil infrastructure analysis easier and safer while transforming the collection of data into an educational tool through guidance from experienced inspectors who have the potential of being thousands of miles away from the bridge focus.

Future Applications

Educational tool, turning a potentially dangerous position to an opportunity to log flight hours.

Longer work life, giving experienced inspectors the ability to work from home.

Better training for the new generation of bridge inspectors.

Optinuent

The most powerful & complete AR Smart Glasses

St. Gregoire Hospital

- EMT use case
 - Sharing perspective
 - Preparing hospital staff
 - Ensuring a well-timed arrival
 - Minimizing chaos

<https://www.youtube.com/watch?v=UH-bEqMJJaQ8>

Brain-Power by Ned Sahin

- Using Google Glass as a Neuro-assistive device
- Staying connected without being distracted
- Based in Boston
- Currently producing 12 different applications to help augment an easier life for children with autism

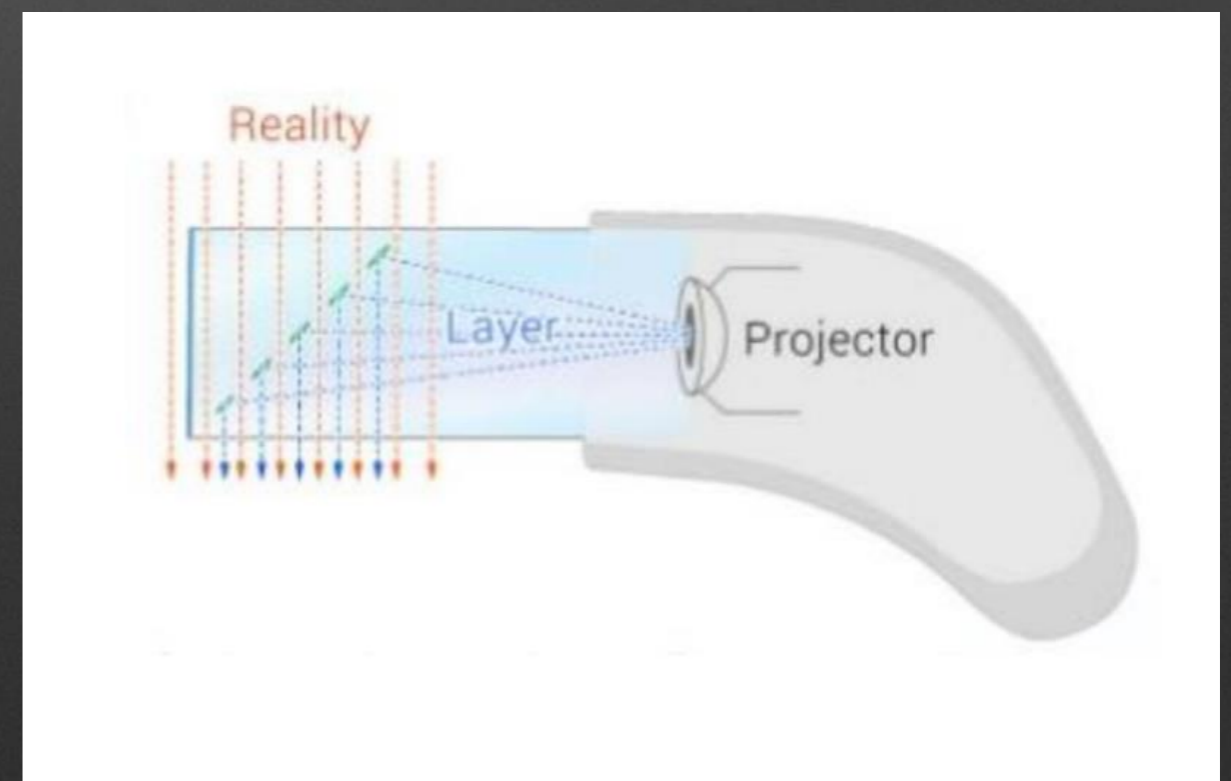

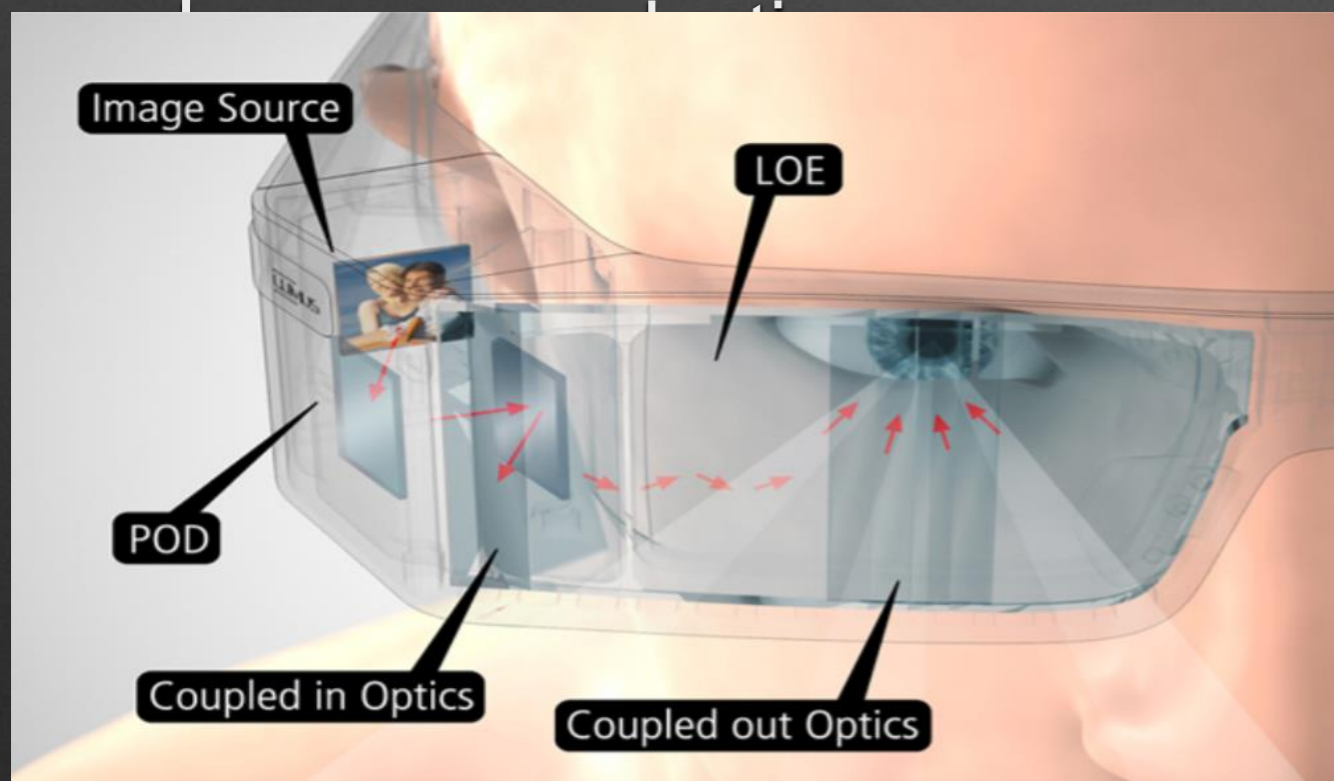

Project Glass

- Explorer Edition was awarded “Best Invention of 2012” by TIME magazine
- Project Glass was cancelled in 2015
- Project Aura is now led by Tony Fadell known for his design of the iPod

- Epson Movario
- Google Glass
- Atheer Labs
- Optinvent ORA-1
- Intel Recon Jet
- 21st Century Fox ODG

The Technology

- Sensors: accelerometer, gyroscope, magnetometer, altitude and humidity sensors
- Communication radios: Bluetooth 4.0, Wi-Fi, and GNSS receiver

The Onclass Team

Purposes

- Cancer Staging
- Intraoperative Oncological Consultations

What do we do?

We act as a digital bridge between an operating room and an analytics lab

Pathology and Surgery dependencies

Survival Rates (in Ovarian Cancer)

- 60% with no residual disease
- 35% with 0.1cm - 1cm of residual disease
- >20% with 1cm-2cm of residual disease

IRB Study at the Hahnemann Hospital in Philadelphia:

Prospective Randomized Clinical Trial Staging Tumors
using Onclass in Gynecological, Breast, and
Colorectal Cancer Surgery
